

SHETH L.U.J. AND SIR M.V. COLLEGE

PRACTICALNO5

The image displays two screenshots of a Google Colab notebook titled "Practical 5: Key Exchange using Diffie-Hellman.ipynb". The notebook is open in a web browser, showing the code editor and the Gemini chat interface.

Top Screenshot: The code editor shows the initial implementation of the Diffie-Hellman key exchange. The code defines public values (p=23, g=5), private keys (a=6, b=15), and calculates public keys (A, B) and shared secret keys (alice_shared_key, bob_shared_key). The Gemini chat interface on the right shows an error message: "ModuleNotFoundError: No module named 'Crypto'". The chat explains that the error occurs because the 'Crypto' library is not installed and provides instructions to install it using 'pip install pycryptodome'.

Bottom Screenshot: The code editor shows the updated implementation, which includes a verification step to ensure both keys are equal. The Gemini chat interface on the right shows the same error message, but the chat explains that the error occurs because the 'Crypto' library is not installed and provides instructions to install it using 'pip install pycryptodome'.

The notebook interface includes a file explorer, a command prompt, and a terminal. The Gemini chat interface is located on the right side of the notebook.
